This book constitutes the thoroughly refereed post-conference proceedings of the 11th IFIP WG 6.11 Conference on e-Business, e-Services and e-Society, I3E 2011, held in Kaunas, Lithuania, in October 2011. The 25 revised papers presented were carefully reviewed and selected from numerous submissions. This book presents selected non-US views of the Barack Obama administration. Each chapter investigates eight years of the Obama presidency from a different national perspective. By bringing together fourteen country studies from all regions of the world, this volume offers an accumulative global view of the Obama White House's foreign policies and bilateral affairs. It provides an outside perspective on a presidency that was initially greeted with much enthusiasm world-wide, but seemed to fall out of favor over time in most countries. The overwhelming hope that was associated with the election of Obama in 2008 turned to disillusionment world-wide; the changes in US external affairs he promised were only partially fulfilled and the world was reminded that America's place and role in the world would not change dramatically, not even under the inspirational Obama.

In recent years, our world has experienced a profound shift and progression in available computing and knowledge sharing innovations. With critical perspectives on the impact of information science management and new technologies in modern settings, including but not limited to computer science, education, healthcare, government, engineering, business, and natural and physical sciences, it is a pivotal and relevant source of knowledge that will benefit every professional within the field of information science and technology and is an invaluable addition to every academic and corporate library.

This book provides a review of the multitude of nucleic acid polymerases, including DNA and RNA polymerases from Archea, Bacteria and Eukaryota, mitochondrial and viral polymerases, and other specialized polymerases such as telomerase, template-independent terminal nucleotidyl transferase and RNA self-replication ribozyme. Although many books cover several different types of polymerases, no book so far has attempted to catalog all nucleic acid polymerases. The goal of this book is to be the top reference work for postgraduate students, postdocs, and principle investigators who study polymerases of all varieties. In other words, this book is for polymerase fans by polymerase fans. Nucleic acid polymerases play a fundamental role in genome replication, maintenance, gene expression and regulation. Throughout evolution these enzymes have been pivotal in transforming life towards RNA self-replicating systems as well as into more stable DNA genomes. These enzymes are generally extremely efficient and accurate in RNA transcription and DNA replication and share common kinetic and structural features. How catalysis can be so amazingly fast without loss of specificity is a question that has intrigued researchers for over 60 years. Certain specialized polymerases that play a critical role in cellular metabolism are used for diverse biotechnological applications and are therefore an essential tool for research.

Policymakers, legislators, scientists, thinkers, military strategists, academics, and all those interested in understanding the future want to know how twenty-first century scientific advance should be regulated in war and peace. This book tries to provide some of the answers. Part I summarises some important elements of the relevant law. In Part II, individual chapters are devoted to cyber capabilities, highly automated and autonomous systems, human enhancement technologies, human degradation techniques, the regulation of nanomaterials, novel naval technologies, outer space, synthetic brain technologies beyond artificial intelligence, and biometrics. The final part of the book notes important synergies that emerge between the different technologies and legal provisions, existing and proposed, assesses notions of convergence and of composition in international law, and provides some concluding remarks. The new technologies, their uses, and their regulation in war and peace are presented to the reader who is invited to draw conclusions.

As a scientist, you are a professional writer: your career is built on successful proposals and papers. Success isn't defined by getting papers into print, but by getting them into the reader's consciousness. Writing Science is built upon the idea that successful science writing tells a story. It uses that insight to discuss how to write more effectively. Integrating lessons from other genres of writing with those from the author's years of experience as author, reviewer, and editor, the book shows scientists and students how to present their research in a way that is clear and that will maximize reader comprehension. The book takes an integrated approach, using the principles of story structure to discuss every aspect of successful science writing, from the overall structure of a paper or proposal to individual sections, paragraphs, sentences, and words. It begins by building core arguments, analyzing why some stories are engaging and memorable while others are quickly forgotten, and proceeds to the elements of story structure, showing how the structures scientists and researchers use in papers and proposals fit into classical models. The book targets the internal structure of a paper, explaining how to write clear and professional sections, paragraphs, and sentences in a way that is clear and compelling. The ideas within a paper should flow seamlessly, drawing readers along. The final section of the book deals with special challenges, such as how to discuss research limitations and how to write for the public. Writing Science is a much-needed guide to succeeding in modern science. Its insights and strategies will equip science students, scientists, and professionals across a wide range of scientific and technical fields with the tools needed to communicate effectively.

Advances in cancer research over the recent decades have been plentiful and often successful, with 5 year survival rates increasing almost uniformly across the board. The advent of new technologies has presented solutions for yesterday's barriers to research, allowing us to leap forward in our ability to prevent, diagnose, and treat various cancers. Developments in omics studies has provided new insights into the underlying molecular basis of different cancers and their subtypes, greatly enhancing our understanding of the vast heterogeneity that exists. Progress in our ability to diagnose and detect early-stage cancers has resulted in numerous screening and prevention programs. Novel imaging technologies allow us to study and comprehend cancers with greater clarity than ever before. Although the field, as a whole, has experienced many successes, arduous challenges must be overcome in order to see continued success. The truth of the matter is cancer related deaths continue to rise in number worldwide, especially in lower- and middle-income countries. It is evident that there is still a lot of work to be done. This Frontiers in Oncology Special Issue marks the 1st edition of a collection of selected articles published in the journal over the course of the previous calendar year, highlighting ongoing research and advances being carried out in the different disciplines of cancer research.
