12.5.2 Gesture Recognition. Hand gestures are recognized by wearing a data glove with a sensor. Hand shape is also detected by the data glove. Hand position is detected by a sensor attached to the glove. Research on gesture recognition without any kinds of devices is being carried out. For example, using two cameras, the left image of a hand shape and the right image are taken.

Gesture Recognition - an overview | ScienceDirect Topics

Research papers based on hand gestures have adopted many different techniques, including those based on instrumented sensor technology and computer vision. In other words, the hand sign can be classified under many headings, such as posture and gesture, as well as dynamic and static, or a hybrid of the two.

Gesture Recognition on Apple Books

Gesture recognition is a topic in computer science and language technology with the goal of interpreting human gestures via mathematical algorithms. Gestures can originate from any bodily motion or state but commonly originate from the face or hand. Current focuses in the field include emotion recognition from face and hand gesture recognition. Users can use simple gestures to control or interact with devices without physically touching them. Many approaches have been made using cameras and comp

Applications of TinyML | Harvard University

Abstract. In recent years, to develop more spontaneous and instant interfaces between a system and users, technology has evolved toward designing efficient and simple gesture recognition (GR) techniques. As a tool for acquiring human motion, a tactile sensor system, which converts the human touch signal into a single datum and executes a command by translating a bundle of data into a text language or triggering a preset sequence as a haptic motion, has been developed.
