Introduction to Kinetics and Equilibrium

Further consideration of the connection between the study of reaction rates (chemical kinetics) and equilibrium. Kinetics, equilibrium, and the reaction coordinate diagram (advanced topic). Chemical equilibrium is the state of constant composition attained when opposing reaction rates become equal. There is an essential relationship between reaction rates and chemical equilibrium, one that we can describe quantitatively.

The study of reaction rates is closely related to the study of reaction mechanisms, where a reaction mechanism is a theory that explains how a reaction occurs. 5.1: Chemical Kinetics We can distinguish two levels of detail in a chemical reaction mechanism: The first is the series of elementary processes that occurs for a given net reaction.

$K_c = (2.0)(4.76 \times 10^{-31}) = 9.5 \times 10^{-31}$. The K_c values for each equilibrium in the sum are those appropriate to the ways in which they are written. Note that K_c for the first reaction in the sum is the inverse of the given value, $1 / K_c$, because it is being used in the reverse direction.

When the reaction quotient is lesser than the equilibrium constant, a chemical reaction will proceed in the forward direction until equilibrium is reached and $Q = K$; however, if $Q < K$, the process will proceed in the reverse direction until equilibrium is achieved..

reactions. This includes the analysis of conditions that affect speed of a chemical reaction, understanding reaction mechanisms and transition states, and forming mathematical models to predict and describe a chemical reaction. The rate of a chemical reaction usually has units of sec^{-1} , however, kinetics experiments may span several minutes, hours, or even days.

Understand Chemical Kinetics and Rate of Reaction

In this equation, A is the surface area of the mineral, k is the intrinsic rate constant, and Q and K are the activity product and equilibrium constant for the dissolution reaction. By this equation, a mineral will precipitate when it is supersaturated and dissolve when it is undersaturated at a rate that depends on its rate constant, which you supply, and surface area.

Reaction kinetics - The Geochemist's Workbench

Enzymes are protein catalysts that accelerate the rates at which reactions approach equilibrium. Enzyme kinetics is the branch of biochemistry that deals with a quantitative description of this process, mainly, how experimental variables affect reaction rates.

The variables that are studied include the concentrations of the enzymes, substrates (reactants), products, inhibitors, activators, the pH, temperature, and ionic strength.
