Comparative Biochemistry of Parasites contains the proceedings of an international symposium

organized by the Janssen Research Foundation and held at Janssen Pharmaceutica in Belgium on September 1-3, 1971. The symposium reviewed progress in the understanding of the physiology and biochemistry of parasites such as protozoa and helminths. Organized into 34 chapters, this volume begins with an overview of early research on parasite biochemistry before turning to a discussion of antischistosomal drugs and their biochemical effects on parasites. The reader is then introduced to the biochemistry of carbohydrates in nematodes

Provides a synthesis of knowledge about the history of life. This work treats the major groups of organisms. It is useful for evolutionary biologists, taxonomists, ecologists interested in biodiversity, and for organismic biologists, botanists, and microbiologists.

Turbellaria, the mainly free-living flatworms, and some of their parasitic relatives, are among the

simplest of the metazoa and, as such, provide ideal models for a wide range of fundamental studies. The 60 contributions to *Biology of Turbellaria and some Related Flatworms* cover taxonomy and phylogeny, biogeography and genetics, ecology and behaviour, Anatomy and ultrastructure, development and regeneration, genes and sequences, and neurophysiology. *Biology of Turbellaria and some Related Flatworms* is the most recent compilation in the series published in *Hydrobiologia* since 1981, covering research on these flatworms assembled by the world's leading authorities on the

group. Audience: These papers present the advanced student and serious researcher with up to date information on an important, but often neglected group whose place in the animal kingdom demands greater attention.

The arthropods contain more species than any other animal group, but the evolutionary pathways which led to their current diversity are still an issue of controversy. Arthropod Relationships provides an overview of our current understanding, responding to the new data arising from sequencing DNA, the

discovery of new Cambrian fossils as direct evidence of early arthropod history, and developmental genetics. These new areas of research have stimulated a reconsideration of classical morphology and embryology. Arthropod Relationships is the first synthesis of the current debate to emerge: not since the volume edited by Gupta was published in 1979 has the arthropod phylogeny debate been, considered in this depth and breadth. Leaders in the various branches of arthropod biology have contributed to this volume. Chapters focus progressively from the general issues to

the specific problems involving particular groups, and thence to a consideration of embryology and genetics. This wide range of disciplines is drawn on to approach an understanding of arthropod relationships, and to provide the most timely account of arthropod phylogeny. This book should be read by evolutionary biologists, palaeontologists, developmental geneticists and invertebrate zoologists. It will have a special interest for post-graduate students working in these fields.
